

TOTTO — AI-ERA DEVELOPMENT PARTNER

Building organisations that work **with** AI — and **as** AI.

Talks · Workshops · Advisory · Agentic Development

WHAT WE DELIVER

Six ways to work with Totto

1 · Talks

Keynotes at company conferences and developer communities.

2 · Workshops

Hands-on team training. SDD, Claude Code, KCP — on your codebase.

3 · Advisory

Agentic maturity review. One-off or monthly retainer.

4 · Agentic Development

We build with you. AI digital workers in production.

5 · KCP / ExoCortex + Skills

Stack implementation + licensed skills library (40 years of dev knowledge).

6 · Agentic Transformation

Future-ready agentic company. End-to-end.

Book one offering — or run the full programme.

01 · OVERVIEW

TALKS

On stage, where the builders are.

Company conferences

Item

Clave

Fremra

Developer communities

Agentbew

JavaZone

javaBin

Example — javaBin Oslo Meetup:

meetup.com/javabin/events/314316420

Practical, opinionated, grounded in production — not hype.

02 · TALKS

The 10x Developer Productivity Workshop

Transform your team into AI-era developers who ship 10× value — with a sharp eye on AI cost.

Iterative loop

You arrive with your own codebase or idea. You leave with Claude that actually knows what it's working on.

Delivered for

Item

Tvimenning

Mynder

Coming **NEW**

Open enrolment for individuals and freelancers.

Before lunch we had written several skills.

I've been on many AI courses that promise a lot and deliver less. This was different. You show up with your own codebase and work with it all day. Before lunch we had written several skills — rules obvious to me, invisible to any AI.

The instructor clearly doesn't just read about AI — he uses the tools daily on real problems. Claude now orients itself quickly in our codebase. Less noise, and an assistant that actually knows what it's working on. After one day we work noticeably smarter with AI.

Ketil Hjerpaasen · Head of Consulting, Item Consulting

Make your codebase agent-ready.

What we assess

- Organisation and team readiness
- Tech stacks and codebase fit for agents
- Which areas can be automated?
- How large is the blast radius?

What you get

- 6–8 technical reports
- Architecture guards
- Security analysis
- Prioritised roadmap for agentic adoption

Available as a **one-off engagement** or as a **monthly retainer** for continuous access.

CASE — CUSTOMER · MAR–APR 2026

21 deliverables in 7 days.

VALUE AT OSLO RATES

10×

THROUGHPUT

Covered

- Architecture analysis
- Security remediation
- Frontend + backend fixes
- Strategic planning

How

- AI-assisted generation
- Pattern-based refactoring
- Characterisation testing
- Synthesis knowledge index

The monthly retainer — five needs.

Agent-ready codebase

More testable, modular,
autonomous-friendly.
Velocity compounds.

Market launches

Blockers patched.
Launch becomes a
scheduling decision.

Migration completion

Architectural guidance
against live production
systems.

Security posture

Secret rotation,
scanning, guardrails —

AI-ready team

Paired workshops +
coached sprints. Muscle
that compounds.

We build alongside you.

AI digital workers running in production. Human-led, not autonomous.

Current builds

- **Mynder** — active build · `mynder.no`
- **elprint** — `lib-electronic-components`
(Apache 2.0, Java)

elprint: MPN normalisation, 17 specialised similarity calculators (resistors, MOSFETs, MCUs, sensors...), BOM validation, metadata for 135+ manufacturers.

Reference agents

Mímir (`ironclaw0`) + Klaw (`ironclaw1`) — 24/7 on AWS EC2.

Proof point

10—
30×

Development speed with controlled quality via

Memory as **infrastructure**, not configuration.

Most AI-dev setups treat memory as text files you maintain by hand. Tutto treats it as a system.

CONFIGURATION APPROACH

- CLAUDE.md, hand-curated skill files
- Manual routing and memory maintenance
- Scales to one developer, breaks at team scale
- Memory rots silently

EXOCORTEX

- Semantic indexing, behavioural scoring
- Deterministic, scheduled memory maintenance
- Scales to 289+ repos, 65,905 files, 476 skills
- Push-based context: 53–80% fewer tool calls

A knowledge index across your entire codebase.

What it does

- Lucene-based, sub-second retrieval across tens of thousands of files
- Knowledge graph of directory purpose and archetype
- Full-text search across Claude Code session history
- 21 security signal types — incl. AI-specific threats
- Auto-generates skills from recurring session patterns

Built because AI generated code faster than a human could locate it. 197,831 lines, 18,000 files, 11 days — the cataloguing problem the printing press had, for code.

1.2s

TO ANSWER "WHAT IF X CHANGES?"

-40%

TOOL CALLS

+67%

HIGH-VALUE REASONING
TIME

Declare → execute → verify.

Exocortex

Human-led agentic workflow. In the loop at the decisions that matter — out of it everywhere else.

KCP

Open standard. `knowledge.yaml` → federated org manifest. Agents understand **structure**. Saves 33% context.

Principle — **agent memory rots.**

`topic-health` + `topic-triage` run nightly, zero LLM calls, human in the deletion loop. Freshness beats completeness.

The Agentic Company — a synchronised organisation.

Every person on the team wakes up to a briefing that already knows what happened yesterday across the whole company, can answer any question about their domain in seconds, and automatically routes information to the people who need it.

No meetings

Morning briefings replace stand-ups and status calls.

No status reports

Mímir composes the pulse; Slack channels carry it.

No copy-pasting

Agents route signals between tools automatically.

Hybrid memory · bridged infrastructure.

Hybrid memory architecture

Shared layer: Product · Strategy · Market intel — cross-role data flow.

Role silos: Finance · GTM · Dev — strict boundaries, no production credential access from agent infra.

Infrastructure stack

Existing tools — Slack, M365/Outlook, Trello+Lovable, SharePoint, CRM, Accounting.

ExoCortex engine — Synthesis Core · `kcp-memory` · `kcp-commands`, bridged via targeted MCPs.

Mimir — the centralised pulse in Slack

From zero to agentic — in six weeks.

WEEK 0

Core infra

Synthesis
workspaces, Mimir
Slack channels.

WEEK 1

Dev activation

Claude Code live,
codebase indexed,
`#mimir-dev` active.

WEEK 2–3

Role activation

Morning briefings,
meeting prep, BD
signals live.

WEEK 4

API hardening

CRM and
Accounting APIs
fully automated.

WEEK 5–6

Polish & showcase

Cross-role query
testing, live demo.

Economic threshold

Infra cost ~**15,000 NOK/month**. Positive
ROI the moment each team member saves
20 minutes a day.

Guardrails from day one

Network isolation · financial outputs cite API
sources · sensitive queries DM-only · hard
spend alerts · documented backup admin ·
gradual channel rollout.

HOW WE ENGAGE

From scoping call to self-sufficient team.

START

30-min scoping call

Fit, goals, constraints.

WEEK 1–2

Maturity review + workshop

Assess, train, align.

WEEK 3–8

Implementation + agentic development

Ship to production together.

WEEK 9+

Handover + train-the-trainer

Your team keeps the velocity.

Or pick any single offering — talk, workshop, review, build.

LET'S TALK

An AI-era codebase.

An AI-era team.

Start with 30 minutes.
